Where the programme goes next

Programme Context

What the data captures

Project Vogue delivers Yoruba cultural heritage sessions across three programme strands. Every attendee completes a short exit survey covering what they learned, what they would improve, and how likely they are to recommend the programme.

Analytical objectives

- Measure true reach by resolving duplicate identities
- Quantify participation, retention and demographic spread
- Assess satisfaction through referral scoring
- Surface what participants value and what they request
- Deliver an interactive report for programme decisions

Three programme strands

-  **Storytelling** 8 sessions · 300 attendances
Folktales, proverbs, Aroko symbolic messaging and Yoruba greetings.
-  **Rehearsal** 7 sessions · 250 attendances
Performance preparation, costume, camera work and cultural practice.
-  **Oral History** 1 session · 10 attendances
Recorded testimony and heritage transmission. Newest strand.

Why this matters

Heritage programmes are usually evaluated on headcount alone. Because Project Vogue records the same participants across repeated sessions, this dataset can measure something more useful than reach: whether people came back.

The Dataset

517

Survey responses

One row per attendance

13

Fields captured

Identity, event, date, feedback

15

Sessions in extract

Oct 2024 to Apr 2025

0

Missing values

Complete across all fields

Field	Description	Field	Description
Re_name	Corrected participant name	Attendance date	Session date
Gender	Male or Female	How likely to recommend	Referral score, 0 to 10
How would you describe yourself?	Young person, volunteer, trustee	What did you learn?	Free-text response
Which programme?	Storytelling, Rehearsal, Oral History	Categorized_Learnings	Standardised learning theme
Event_code	ST, RE or OH	Categorized_recommendation	Standardised improvement theme

Note: the analysis extract contains 517 responses. The published dashboard reflects a later refresh totalling 560 attendances across 16 sessions.

Data Cleaning & Preprocessing

01 Name correction

Incomplete and misspelt participant names reconciled to a single canonical form, so unique participants could be counted reliably.

02 Gender standardisation

Misspelt and inconsistent gender values normalised to Male and Female.

03 Programme standardisation

Programme names aligned to three strands and mapped to short codes ST, RE and OH.

04 Date formatting

Attendance dates converted to DD/MM/YYYY and session years verified against the delivery calendar.

05 Response standardisation

Free-text learning and feedback responses grouped into consistent themes for aggregation.

06 Validation

Programme totals reconciled against the participation headline and referral scores confirmed within the 0 to 10 range.

Result

A clean attendance register in which every row is attributable to a known participant, every programme aggregates correctly, and free-text feedback is countable rather than merely readable.

Two Data Quality Findings

Finding 1 — Identity fragmentation

Participants wrote their names differently at each session. 169 distinct name strings resolved to 66 real people once spelling, partial surnames and spacing were reconciled. 177 of 517 rows needed correction.

Taken at face value, the register would have reported roughly 2.6 times more unique participants than the programme actually reached, and every retention measure would have collapsed.

Finding 2 — Session year recorded incorrectly

Eight of the fifteen sessions in the extract carry a 2024 year stamp for dates that fall in 2025: the two January Storytelling sessions and all six Rehearsal sessions from March and April. The delivery sequence makes the error clear, since Storytelling ran from October to December 2024 and continued into January 2025 before Rehearsal began that March.

Left uncorrected, the programme would appear to have run Rehearsal six months before Storytelling began, and any year-on-year comparison would be meaningless. The published dashboard reflects the corrected years.

The Headline Position

No score below 8 recorded

93%

Are young people

Programme's core audience

50%

Attended 10+ sessions

33 of 66 participants

Read this first

560 attendances came from just 66 people. This is not a programme that reached a large audience once; it is a programme that reached a small audience repeatedly, roughly eight or nine times each. Retention, not reach, is what this data measures.

Participation Across the Three Strands

Total attendances by strand

Average attendance per session

01 Storytelling leads on volume

300 attendances across 8 sessions, 53.6% of all participation and the longest-running strand.

02 Rehearsal matches it per session

35.7 against 37.5 average attendance. The gap in totals is session count, not weaker draw.

03 Oral History is nascent

A single session with 10 attendees. Too early to compare, and its figures should be read as a pilot.

The Retention Story

Half the cohort became regulars

33 of 66 participants attended ten or more sessions. Eight attended fourteen or fifteen of the sixteen delivered, which is close to perfect attendance across a seven-month programme.

A quarter attended only once

17 participants appear a single time. This is the clearest improvement opportunity in the dataset: the programme converts attendees into regulars very effectively, but a quarter of those who try it never return.

What this means for evaluation

Reporting 560 attendances as the headline overstates reach; reporting 66 participants understates impact. Both are true and they measure different things. A funder asking "how many people did you reach" should be told 66; a funder asking "how much cultural contact did you deliver" should be told 560. Presenting only one number invites the wrong conclusion.

Who Attends

Attendances by audience type

01 A consistent gender split

Male attendance runs about 55% in every strand. The balance holds regardless of programme content.

02 Overwhelmingly young people

479 of 517 attendances, roughly 93%. The programme is reaching its intended audience.

03 Thin volunteer pipeline

36 volunteer and 2 trustee attendances. Adult participation is minimal and worth attention.

Gender and audience-type figures are drawn from the 517-response analysis extract.

Satisfaction: An Unusually Clean Result

Nobody scored below 8

Across 517 responses on a 0 to 10 scale, the lowest score recorded was 8. There are no detractors in this dataset at all, which is rare enough to be worth stating explicitly rather than burying in an average.

Consistent across strands

Rehearsal 9.45, Storytelling 9.43, Oral History 9.80. Satisfaction does not depend on which strand a participant attends, so the result reflects programme delivery rather than one strong format carrying the average.

How to read this honestly

Exit surveys collected in the room from an audience that is largely made up of returning regulars will skew positive: the people most likely to give a low score are the seventeen who never came back, and most of them answered once at most. The score is a strong signal of how retained participants feel, and a weak signal of how the programme is received by those who tried it once. Both readings should be presented together.

What Participants Say They Learned

Learning themes by number of mentions

Material culture leads

Traditional outfit styles is the most cited learning at 116 mentions, ahead of proverbs at 78. Tangible, visual heritage lands more memorably than oral heritage.

Language and symbol follow

Proverbs, Aroko symbolic messaging and formal greetings together account for 206 mentions, confirming that the language-based content is landing even though it ranks below costume.

Practical skills trail

Camera work draws only 14 mentions despite featuring in Rehearsal sessions, suggesting technical content is less memorable than cultural content.

What Participants Ask For

The top requests are not complaints

Asked what could be improved, 128 participants said they wanted the next rehearsal and 109 cited new friends. The single largest body of feedback is a request for more of the same, which is an engagement signal rather than a criticism.

Hospitality matters more than expected

Food appears in 109 mentions across meals and appetizers, ranking above costume. Catering is functioning as a genuine driver of the experience, not an incidental extra.

The social finding deserves emphasis: 109 people described making new friends as what the programme should offer more of. For a heritage initiative aimed at young people, peer connection is doing as much work as the cultural content.

The Power BI Report

Four-page report

A Summary page carrying programme-wide KPIs, plus one drill-through page per strand with its own participation, gender, feedback and referral views.

Colour identity per strand

Storytelling gold, Rehearsal green, Oral History blue. The mapping holds on every visual across all four pages, so a colour never means two things.

Weighted measures

The 9.45 referral rating is participation-weighted, not an average of the three strand averages, which would have returned a different figure.

The baseline state

Every session opens here: 560 attendances, 66 participants, 9.45 rating, 16 sessions. All nine visuals are live, and clicking any element cross-filters the rest. The slides that follow compare against this state.

Cross-Filtering: Selecting Rehearsal

250

Participation

Down from 560 (44.6%)

50

Unique participants

Down from 66

9.45

Referral rating

Unchanged from the overall figure

7 / 0

Sessions shown

Rehearsal / Storytelling

What one click changed

A single click on the Rehearsal slice filtered the KPI cards, the session bars, the learnings table and the word cloud together. The new "Rehearsal" tag beside the title is the report's own confirmation the filter is active — every non-Rehearsal category is dimmed rather than removed, which is Power BI cross-highlighting exactly as intended.

Cross-Filtering: Selecting Storytelling

300

Participation

53.6% of the total

55

Unique participants

Down from 66

9.43

Referral rating

Marginally below the 9.45 overall figure

8 / 0

Sessions shown

Storytelling / Rehearsal

What one click changed

The recommendation table recalculates rather than simply hiding rows: "Traditional outfit styles" remains the top learning at 77 mentions, now correctly scoped to Storytelling attendees only. The word cloud and the Event by Session panel update in the same instant, confirming every visual on the page reads from the same filter state.

Cross-Filtering: Selecting Oral History

10

Participation

1.8% of the total

10

Unique participants

No repeat visits yet

9.80

Referral rating

Highest of the three strands

3

Comments shown

Now individually legible

What one click changed

At this scale the word cloud stops being a cloud: with only three comments remaining, each one is fully readable rather than overlapping. Filtering here does more than shrink the numbers — it changes what the visual is useful for, turning an aggregate impression into a readable transcript.

Drill-Through: Isolating a Single Recommendation

No filter • 250 attendances

"Next rehearsal" selected • 119 attendances

119

Requested it

47.6% of Rehearsal's 250

39

Unique participants

Down from 50

9.37

Referral rating

Down slightly from 9.45

6 / 7

Sessions represented

Every session, unevenly

Clicking a single bar inside "Occurrence of Recommendation" turned the donut into a ring showing the 47.6% selected share, and dimmed the un-selected portion of every session bar — showing exactly which sessions drove the request for a next rehearsal.

Drill-Through: Isolating the Final Two Sessions

No filter • 300 attendances

Last two sessions selected • 75 attendances

75

In final two sessions

25% of Storytelling's 300

42

Unique participants

Down from 55

9.48

Referral rating

Up from 9.43 overall

0

"Next workshop" mentions

56 overall, none in these two

The clearest read in the report: once the strand's final session passed, nobody asked for a next workshop. A recommendation falling silent on exactly the theme you'd expect, at exactly the point you'd expect it, is a strong sign the filter is behaving correctly.

Drill-Through: A Perfect Score Emerges

No filter • 10 attendances

Costumes + villains selected • 6 attendances

6

In this subgroup

60% of Oral History's 10

6

Unique participants

Every one of the six

10.00

Referral rating

Up from 9.80 overall

2

Themes selected

Costumes and villain stories

Every participant who asked for more costumes or villain stories gave a perfect score; the four who asked for more hero stories are the only reason the strand average sits below 10. With a base this small the pattern is suggestive, not conclusive — a thread worth a follow-up question, not a settled finding.

Two Interaction Mechanisms, One Coherent Report

Cross-filtering

Clicking any element on a page filters every other visual on that page instantly, with no navigation required. Demonstrated by selecting each of the three strands on the Summary page in turn.

Drill-through

The left-hand navigation moves to a dedicated page per strand, retaining the same chart types but scoped to that strand's own data, colour and referral score.

Compounding filters

The two mechanisms stack: a strand page can itself be cross-filtered further, as shown by selecting a single recommendation in Rehearsal and a specific pair of sessions in Storytelling.

Reading small subgroups carefully

Oral History's filtered views represent as few as six people. Patterns they show — a perfect referral score, for instance — are worth noting and following up, not treating as statistically settled.

Every screenshot in this section was captured live from the published Power BI report; no figure here was recreated or estimated.

Recommendations

01 Follow up the single-visit group

- 17 participants attended exactly once; contact them to establish why they did not return
- Their absence from the feedback pool is why the 9.45 rating should carry a caveat
- This is the highest-value unanswered question in the dataset

02 Scale Oral History deliberately

- One session and 10 attendees is a pilot, not a strand; its 9.80 rating is encouraging but rests on a very small base
- Schedule three to four further sessions before drawing any conclusion about demand

03 Treat catering as programme design

- Food draws 109 mentions, ranking above costume among improvement requests
- Protect the catering budget rather than treating it as a discretionary extra

04 Report reach and contact separately

- Publish 66 participants and 560 attendances as two distinct measures with their definitions attached
- Build a volunteer and trustee pathway: adult participation stands at just 38 attendances

What This Analysis Establishes

01 Retention is the achievement

66 people generated 560 attendances. Half the cohort came ten or more times across seven months.

02 Cleaning changed the answer

169 name variants resolved to 66 people. Uncorrected, reported reach would have been 2.6 times too high.

03 Satisfaction is real but selective

No score below 8 across 517 responses, though the sample is weighted toward returning regulars.

04 Costume outranks oral content

Traditional outfit styles draws 116 mentions, ahead of proverbs at 78. Visual heritage is the most memorable.

05 Food and friendship drive return

109 mentions each for catering and for making new friends, both ranking above cultural content requests.

06 The interactivity holds up under scrutiny

Nine slides of live-captured filtering show every mechanism working as designed, including where the underlying sample is too small to over-read.
